

Quick analysis on Rewarded Videos performance

Data set: 03/19/22

Introduction

- Following the analysis of a data set concerning Rewarded Videos, several potential issues have arisen
- This doc is structured per issue, and will both present the analysis and propose some leads for optimization or change

Data set

- Exported: 03/19/22
- Start date: Unknown
- Events: Placement/Action/Count/Platform/Day since install
- Specificities:
 - Platform = Android
 - Dn: $n \leq 7$

Level Claim

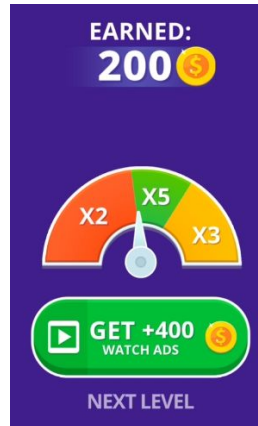

Issues listed

- Level claim events reveal at least 2 issues:
 - 1 internal issue:
 - “Specials” underperform compared to “Regulars” (Special global perf is 34% or 39% of Regular’s)
 - “GemRush” doesn’t over-perform compared to “NormalLevel” (perf is only 27% higher)
 - 1 global issue:
 - Overall performance seems low to me (Maybe it’s not and I need to have more benchmarks from other games)

Proposal

- Implement a “reward-o-meter”, as competitors do
- Several benefits:
 - The button really calls to action
 - There is no “waiting for better” effect
 - It is still possible to have some “reward-o-meter” better than others (they just need to overlap) to create conversion situations
- Competitors:

Soft currency and Items

Situation

- I had made the guess that, after some time, SC may lose some of its interest, because people would have found the item they wanted
- I don't have additional clues on what happens AFTER players got the items they wanted
- But I was surprised to see that BEFORE, going for random (get SC from MoreGems) was as high as 63% of going for specific (Skinpayment)
 - although it very quickly also requires at least 3 ads to do so (3 ads: 450SC / 1st random rare or 2nd common: 350 SC and increasing)
- MoreGems correspond to 37% of Global Level Claim RV, although GLC is actively displayed to the player whereas they have to look for MoreGems

Proposal

- By putting the rewarded video on home rather than on tab, we may increase perf
- Later on, to give the player a feeling of “risk of loss”, we could even limit it (0/3 for example) to make player watch them even when they don’t need them
 - Must be compared to “if we only take player already using MoreGems, how many they watch per day”.
 - If it’s under 3 or approx 3, it’s good. If it’s around 5, maybe we should update to 0/5. If it’s more, we should forget about it, because 0/10 doesn’t give a feeling of emergency.
- Both these proposals can be A/B tested

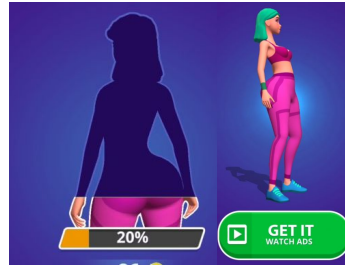

Limited number of
Items

Situation

- This is not really an issue, it's rather a good news: Gift RV is over-performing
 - 6th in display, but 2nd in watch
 - Best global perf: 11.63%
- Even if we would need to go deeper to prove it, the perf of MoreKeys (8.6%) could also be an indicator that players are willing to collect exclusive items
 - Both perf are higher than Revive (6.05%) for example
- *Technical issue: I have not encountered myself the gift feature, so it's hard to be certain of what it looks like. I considered it was the equivalent of competitors feature*

Proposal

- We should create new items
- We should deliver them through *exclusive* situations
- These situations can be Gift and Chest, of course, but also new ones
- Main proposal is to create daily events, linked to time-limited content
 - Approx 5 daily event to get an item
 - Item changes every week, there are 10 of them, after 10 week they cycle
 - Event are linked to interstitials and rewarded videos to keep monetizing properly on new content
