

The Reward-o-meter

High Level

What is this document?

- This is a quick presentation of a new feature we are going to put in the game
- The purpose of the feature is to increase the overall performance of end level Rewarded Videos (*more details after*)
- The feature is already in our competitors' game and seems quite simple, yet please raise any concern you would have

Situation

- Quanti

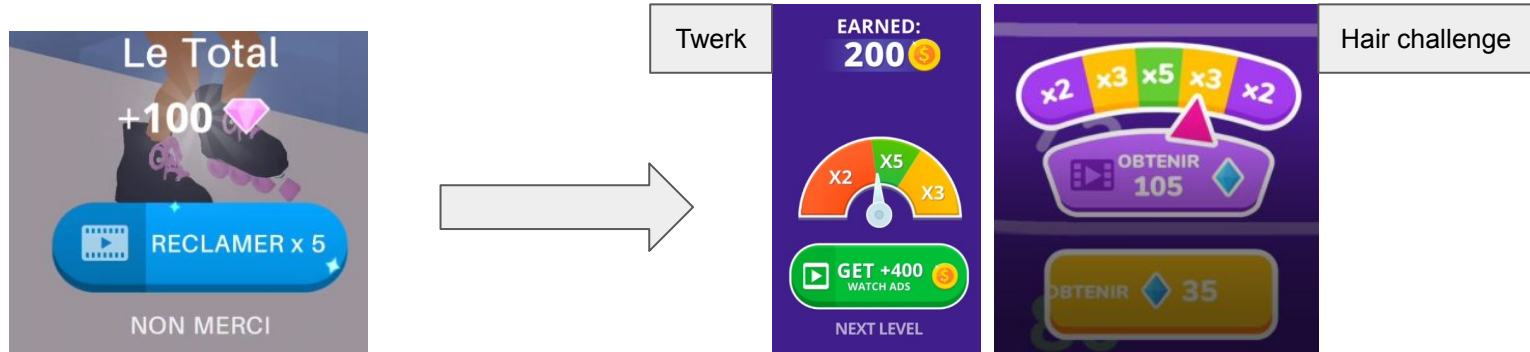

- “Specials” RV underperform compared to “Regulars” RV
 - Special global perf is 34% or 39% of Regular’s
- “GemRush” doesn’t over-perform compared to “NormalLevel” (perf is only 27% higher)
- Overall performance seems low

- Quali

- During my own playtest, I tended to “wait for better” in our game, whereas I tended to click when playing the competitors
- The shape of the widget itself is a call to action, you may even click before you realize it is a Rewarded Video feature

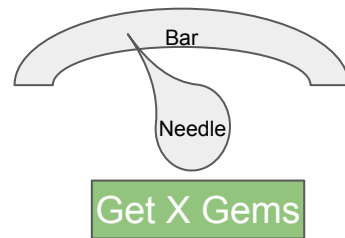

A new end level widget

- At the end of a level, instead of having a flat gem multiplier associated to Rewarded Video, Player will encounter a variable gem multiplier, determined by a widget
- Depending on the scenario chosen, Player would (need A/B test):
 - Always encounter the widget
 - Encounter the widget only in situations previously corresponding to NormalLevelClaimSpecial, GemRushClaim, and GemRushClaimSpecial

Widget properties

- Widget itself made of a needle and a bar
- A dynamic button is associated to the widget
- Bar has several sections
- Needle properties
 - Speed must be fine-tunable
 - Slow down when changing direction should be configurable, even if 0 per default
- Bar sections properties
 - Each section has a multiplier
 - Each section has size expressed as a percentage of the bar
 - Bar can be dynamically created based on number of sections and size of each
 - Order of sections follow the config
 - It is possible to have several times the same multiplier
- Button property
 - Button contains a value in SC that is dynamically updated when the needle moves
 - Clicking the button stops the needle and triggers a rewarded video
 - The “look” of the button must clearly show it's associated with a Rewarded Video. Ref: 

Global config properties

- It should be possible to configure several widgets, and give them IDs
- It should be possible, based on their IDs, to associate each level with one of them
- Several methods of association should be considered:
 - Based on level (level X is associated with widget Z) or based on previous system (GemRushClaimSpecial is replaced by widget Y)
 - Association with a single widget (widget X) or with a weighted list (widget X [33%], widget Y [50%], widget Z [17%])
 - Nota: here it's percentage, but it should be weights, with dynamic calculation of percentage

Analytics & A/B test

- Analytics should provide the usual informations:
 - What widget
 - When
 - Displayed / Watched
- Optional
 - Initial SC (0-50 / 51-100 / 101-150 / 150+)
 - Final multiplier
- Being able to A/B test one/several of following situations would be a plus:
 - Previous design (without widget) VS widget-based design
 - Only widgets VS widgets in some situations and flat bonus in others
 - Same widget everywhere VS Different widget based on the location
